Paid Master Project:  
Histochemistry of 'mucilage' in extant gymnosperms.

Attention, master students seeking a research opportunity! We have an enticing project tailored just for you.

Join us in unraveling the mysteries of secretion across non-resiniferous gymnosperms, with a special emphasis on Ginkgo and Gnetales. Our primary objective is to identify the nature of these secretions and shed light on their unique properties.

Throughout this project, you will gain invaluable skills in various aspects of plant tissue collection, fixation, anatomical sectioning, histochemical staining, as well as proficiency in light and fluorescence microscopy. These skills will equip you with a solid foundation in plant anatomy and microscopy techniques, invaluable for future research endeavors.

Join our team and embark on this captivating journey of discovery, expanding your knowledge, honing your technical expertise, and making a meaningful contribution to the realm of plant science. Don't miss this chance to take your master's studies to the next level. Apply now and be part of a groundbreaking project that unveils the secrets of nature!
